What is naloxone and why do you need it?

Naloxone is an antidote to opioid overdose. Taking too much of opioid drugs (like morphine, oxycodone, methadone, heroin, or fentanyl) can slow or stop breathing. Naloxone restores normal breathing and consciousness within 1 to 5 minutes of injection. Giving naloxone can prevent death or brain damage from lack of oxygen during an opioid overdose. Naloxone can be injected through clothing into the big muscle of the thigh, arm, or buttocks.

Your naloxone purchase should include:
- At least 2 doses 0.4 mg/ml naloxone
- At least 2 retractable VanishPoint® syringes

Signs of an Opioid Overdose

- Not responsive to noise or touch
- Breathing will be slow or absent
- Choking, gurgling or snoring sounds
- Lips or nails are blue, skin is cold or clammy
- Pupils are tiny

Overdose is a medical emergency - CALL 9-1-1 | Tell attendant: Person is not responsive and not breathing.
